

Oportunidades comerciales entre Asia, América Latina y el Caribe

Marcel Vaillant (Universidad de la República, Uruguay)

XXIX REUNIÓN DE REDIBERO, 30 de noviembre 2017

Punta del Este

A METHODOLOGY TO IDENTIFY GVC: A NEW PERSPECTIVE TO ANALYSE INTERNATIONAL TRADE

**Marcel Vaillant, (Universidad de la República, Uruguay)
Enrique Gilles, (Universidad EAN, Colombia)**

**24th International Input-Output Conference & 6th Edition of the
International School of I-O Analysis 4-8 July 2016, Korea, Seoul**

Presentation outline

1. Justification and objectives
2. Methodology
3. Data and Results
4. Conclusions

Fragmentation of production

- Different stages of productive processes are now spread over different national jurisdictions
- Basic force: reduction in trade cost
 - Technological nature
 - Goods- containers and cargo unitization
 - Services- Information technologies and telecommunications
 - Policies liberalization
 - Trade : mix unilateral, preferential and multilateral agreement.
 - Investment: unilateral policies and preferential agreements

Trade modes

- Conventional trade -One country sells to another
 - Final goods (services) and
 - Intermediate goods (services) which will be elaborated for final consumption.
- Supply Chain Trade: Import to export. Typical case:
 - High tech manufactured firms combined know how with low salaries in developing countries to produce a good for the international market.
 - Main sectors: transport equipment; electrical and optical equipment ;and chemicals.

Characteristics typical Global Value Chain case

- Technological asymmetry
 - Headquarter economies: US, Japan and Germany, new evolving Taipei and Korea
 - Factory economies: China, India, Turkey, Indonesia, Thailand, Poland
 - Micro perspective: leader firm MC/Supplier main components/Assembly/Leader firm (distribution product,..)

Characteristics of typical GVCs case

- Regionalization
 - GVCs are mainly regional: Europe; North America; South East Asia.
- Policies requirements
 - trade policy package that includes a set of traditionally domestic issues but that are essential for a dynamic integration in GVCs.
 - Increase the exchange of intermediate goods but mostly increases knowledge sharing. This requires new disciplines and rules.

How are GVC in others sectors with other countries participation?

- Trade in final goods are reduced in all sectors or trade in intermediate increases everywhere (Baldwin and Lopez Gonzalez, 2013)
- Sectors
 - Natural resources: Agricultural (Food and Raw materials); Fuels and minerals
 - Other matures manufactures (textiles and apparel)
 - Services (BPO, KPO)
- Have all the same characteristics?:
 - Developing countries could only participate as providers of low labor cost?
 - Technological asymmetries and governance of GVCs: these others networks could have many different shapes. **It will be useful to develop a typology of the different GVCs, considering, among other criteria:**
 - **the role played by the lead country (firm) in the network.**
 - Type of regionalization of the different networks
 - Trade policy requirements

Methodology: Three alternatives

- 1) National input-output tables into larger international (global and regional) input-output tables (IIOTs).
 - Coverage mainly developed countries and selected emerging markets.
- 2) Case studies at a level of specific sectors and /or firms tracking value chain at the highest level of disaggregation (product and firm). Needs new data and so it needs new surveys. Restricted to some countries.
- 3) Analyzed trade data to elaborate a global architecture of GVCs networks by type of product, using available information at a global and regional level. Global coverage.

	Weakness	Strenght
1) IIOTs	<ul style="list-style-type: none"> • Harmonization problems among countries (developing countries is worst) • Level of aggregation • Assumptions to solve data problems- Proportionality 	<ul style="list-style-type: none"> • Consistency and balancing • Standard well know measures of IO literature applied to the global economy
2) Case Studies- firms and sectors	<ul style="list-style-type: none"> • Restrictions to generalize results to global economy • Cost of collecting new data 	<ul style="list-style-type: none"> • Level of disaggregation • Value added origin and value added capture (origin of capital)
3) Trade Data and Trade Policy	<ul style="list-style-type: none"> •Consistency and balancing •Geographic distribution and flow of value added •Level of aggregation- could be difficult to link inputs and outputs. 	<ul style="list-style-type: none"> • Systemic approach using trade and trade policy data: a) specialization indexes and Graph theory. b) gravity models.

GVCs a complex phenomenon to measure

- Each method has its own weakness and strength
- Restrictions in the availability of good information
 - In particular developing countries not good primary information (or too less) about international inter industrial relationships.
 - Use available data: opportunity and disaggregation level
- Measure and interpretation needs an eclectic approach that combine the different type of methods.

Objectives

- Develop a new methodology to measure trade in GVC
 - combining trade data and IO information.
 - increase coverage of countries
- Build the basic data to be able to track the sequence of stages of product transformation in the trade net at high level of disaggregation
- Characterize trade with this new tools between particular regions and trade blocs
 - South East Asia and Latin America
 - TPP+3 and MERCOSUR+2
 - China, India, EU, ROW

Organization presentation

1. Justification and objectives
2. Methodology
3. Results
4. Conclusions

New tools for a new methodology

- Modern empirical methodology that describes international trade as a net that links countries with products (bipartite net) .
- See:
 - Hausmann, R. e Hidalgo, C., 2009. The Building Blocks of Economic Complexity.
 - Hidalgo, C.A., Klinger, B., Barabási, A.L., Hausmann, R., 2007. [The product space conditions the development of nations.](#)

“New” tools for the new methodology

- Previous result proximity among products in the:
 - Export space
- Generalize the methodology to link inputs with outputs using export and import data simultaneously.
 - Export-import space.
- Amador and Cabral (2008). “Vertical specialization across the world: a relative measure”.

Trade Specialization: Two Bipartite Networks

- Trade Bipartite Network (\mathcal{T}) is defined by:
 - Two groups of nodes: products (\mathcal{P}) and countries (\mathcal{C})
 - Edges (\mathcal{E}) that connect products with countries
$$\Rightarrow \mathcal{T} = \{\mathcal{P}, \mathcal{C}, \mathcal{E}\}$$
- Edge connects a country with a product
 - When product i has a share in country j trade (import or exports) that is sufficiently greater (\underline{u}_1) than the world average (Balassa)
- Two matrix summarize trade specialization: **M** for imports and **X** for exports (**T=M,X**)
 - Products are in rows and countries in columns
 - Binary entries (value 1 if there is an edge and 0 if there is not)

Three stages

- Trade revealed link between input and outputs at product level
- Input Output relationship expanded to the product dimension
- Combination of both information produces to different dyads:
 - country of destiny c imports a product j to be incorporated in a certain export product i .
 - *country of origin c' exports a product i which uses some import product j*

1 stage: proximity inputs (I) and outputs (E)

- Revealed link by trade between an export product and an import one (number of countries both are associated)

$$E_{PxP} = XM' = \begin{bmatrix} e_{ij} \end{bmatrix}$$

- Probability of have RCA in export product i conditional of have a specialization in import product j .

$$En_{PxP} = XM' \left[D(m^p) \right]^{-1} = \begin{bmatrix} \frac{e_{ij}}{\sum_c m_{jc}} \end{bmatrix}$$

- Unconditional probability of been specialized in export product $i = \begin{bmatrix} \frac{\sum_c x_{ic}}{C} \end{bmatrix}$.

- Conditional over unconditional sufficiently greater

$$E_{bPxP} = \begin{bmatrix} e_{bij} = 1, \text{ if } C \left[D(x^p) \right]^{-1} XM' \left[D(m^p) \right]^{-1} > \underline{u}_2, \\ \text{otherwise } e_{bij} = 0 \end{bmatrix}$$

2 stage: Input Output relationship

- Disaggregated Input Output Matrix

$$A_{S \times S} = [a_{ss'}]$$

- Link between sectors greater than certain threshold

$$\bar{A}_{S \times S} = \left[\bar{a}_{ss'} = 1 \text{ if } a_{ss'} > \underline{u}_3 \text{ otherwise } \bar{a}_{ss'} = 0 \right]$$

- Correlations table from sectors to products and expansion of the input-output table

$$\bar{\bar{A}}_{P \times P} = \left[\bar{\bar{a}}_{ij} = 1 \text{ if } \bar{a}_{ss'} = 1, i \in s, j \in s'; \text{ otherwise } \bar{\bar{a}}_{ij} = 0 \right]$$

3 stage: Combination

- Connection between export product i and import product j revealed by international trade and IO relationship

$$G_{PxP} = E_b \cdot \bar{A}' = \left[g_{ij} = e_{ij} \bar{a}_{ji} \right]$$

- Participation of each country c in GVC

$$E^c_{PxP} = x_c m_c' = \left[x_{ic} m_{jc} \right] = \left[e_{ij}^c \right]$$

$$G^c = G \cdot E^c = \left[g_{ij} e_{ij}^c \right]$$

- ✓ Rows: export product i linked with some import input j
- ✓ Columns: import input j linked with some export product i

Organization presentation

1. Justification and objectives
2. Methodology
3. Data and Results
4. Conclusions

- BACI Average trade 2009-2014, HS 2002, 6 digits
 - Source: CEPII
- Commodity by Industry Matrix (385x385), Commodity-by-Commodity Direct Requirements (385x385), after Redefinitions Table, year 2007, 6 digit BEA codes
 - Source: US Bureau of Economic Analysis.
- Correlations table HS to BEA built from 2 sources:
 - HS-NAICS (Pierce & Schott, 2009)
 - NAICS-BEA (Bureau of Economic Analysis)

First approach to the results

- Checking preliminary results to analyze the consistency of the methodology
- Zoom in a particular case LA and Asia.
- We link a HS 6 digit product (#5218) with a country of destiny (#92)
 - Region and sector (BEA 2,3 and 6 digit) perspective
 - main flows

Organization presentation

1. Justification and objectives
2. Methodology
3. Data and results
4. Conclusions

Conclusions

- New Methodology
 - Revealed links between input and outputs in international trade combining trade data with IO relationships.
 - increase the coverage of countries and sectors to analyses GVC.
 - could be applied over yearly data
- First preliminary evidence of the consistency of the methodology:
 - styles facts are aligned with previous results in the literature.

Conclusions

- Import to export (2009-2014)
 - 44 % GVC_exports
 - 27% GVC_imports
 - Participation:
 - ASEAN+5 at the top +40% GVC_e/E and 44%GVC_i/I
 - MERCOSUR at the bottom -2% GVC_e/E and 1% GVC_i/I
 - NAFTA+CA +13 GVC_e/E and 18% GVC_i/I
 - Three types of sectors
 - Basic inputs (agricultural, minerals)
 - Intermediate low transformations (textile, food&beverage)
 - Technological inputs (chemical, metalmechanical and electronics)
 - Sectors and regions I2E
 - Exporter basic inputs MERCOSUR
 - Technological inputs: TPP (USA, Japan); EU (Chemical)

Conclusions

- Bilateral trade I2E highlighted relationships:
 - Mainly intraregional with FTA relationships
 - Low participation of LA countries in GVC less in exports as provider of imports that will be used in others GVC
 - Three examples with ASEAN+5:
 - Brazil
 - Chile
 - Costa Rica

Main basic unity to identify GVC

- Final objective is tracking an input (and its value added) over the trade net
- The idea is that trade data could reveal that sequence. How? Using network techniques in the analysis of international trade.
- The paper builds the basic information that allows to do this task in the FUTURE!!!
- Complete with FDI flows and trade in services

Thank you
